Abstract: In this paper, we obtain new extremal functions for starlike functions and convex functions on the range

\[0 \leq \alpha \leq \frac{1}{2^{1/3}}\]

defined on the unit disk using analytic and univalent functions.

Keywords: Starlike function, convex function, analytic function, extremal function.

1 Introduction

Definition 1. Let \(U = \{z \in \mathbb{C} : |z| < 1\}\). A function analytic \(f(z) = z + \sum_{n=2}^{\infty} a_n z^n \in A\) is said to be starlike of order \(\alpha\) if it satisfies

\[\text{Re} \left( \frac{zf'(z)}{f(z)} \right) > \alpha, \quad (z \in U)\]

for some real \(\alpha (0 \leq \alpha < 1)\). The class of starlike functions \(f(z) \in A\) of order \(\alpha\) is denoted by \(S^*(\alpha)\).

Also, a function \(f(z) \in A\) is said to be convex of order \(\alpha\) if it satisfies

\[\text{Re} \left( 1 + \frac{zf''(z)}{f'(z)} \right) > \alpha, \quad (z \in U)\]

for some real \(\alpha (0 \leq \alpha < 1)\). The class of convex functions \(f(z) \in A\) of order \(\alpha\) is denoted by \(K(\alpha)\). Where \(f(0) = 0\) and \(f'(0) = 1\). [1],[4],[5].

Remark.

\[f(z) \in K(\alpha) \Leftrightarrow zf'(z) \in S^*(\alpha)\]

\[f(z) \in S^*(\alpha) \Leftrightarrow \int_0^z \frac{f(t)}{t} dt \in K(\alpha)\]

Definition 2. Let \(p(z)\) be analytic in \(U\) with \(p(0) = 1\). If \(p(z)\) satisfies

\[\text{Re} p(z) > 0, \quad (z \in U)\]
then \( p(z) \) is said to be the Carathéodory function. We denote by \( P \) all Carathéodory functions.

**Example 1.** Let us define a function \( p(z) \) by

\[
p(z) = \frac{1+z}{1-z} \quad (z \in U)
\]

Then \( p(z) \) analytic in \( U \) with \( p(0) = 1 \). Furthermore, for \( z = re^{i\theta} \) \((0 \leq r < 1, 0 \leq \theta \leq 2\pi)\), we know that

\[
\text{Re}p(z) = \text{Re} \left( \frac{1 + re^{i\theta}}{1 - re^{i\theta}} \right) \geq \frac{1 - r}{1 + r} > 0.
\]

Thus

\[
p(z) = \frac{1+z}{1-z} \in P.
\]

**Lemma 1.** [2] If \( p(z) = 1 + \sum_{n=1}^{\infty} p_n z^n \in P \) then

\[
|p_n| \leq 2 \quad (n = 1, 2, 3, \ldots).
\]

Equality is attended for

\[
p(z) = \frac{1+z}{1-z} = 1 + \sum_{n=2}^{\infty} 2^{n-1} z^n.
\]

**Proof.** We use the following fact that if \( p(z) \) is analytic in \( U \) and \( \text{Re}(z) > 0 \) \((z \in U)\), then \( p(z) \) can be written by

\[
p(z) = \int_0^{2\pi} \frac{e^{it} + z}{e^{it} - z} d\mu(t) + i\gamma,
\]

where \( \mu(t) \) is the probability measure such that

\[
d\mu(t) \geq 0 \quad \text{and} \quad \int_0^{2\pi} d\mu(t) = 1.
\]

With above fact, if \( p(0) = 1 \), then \( \gamma = 0 \). Therefore, we can write the function

\[
p(z) = \int_0^{2\pi} \frac{e^{it} + z}{e^{it} - z} d\mu(t)
\]

we see that

\[
\frac{e^{it} + z}{e^{it} - z} = 1 + e^{it} z = 1 + \sum_{n=1}^{\infty} e^{-int} z^n.
\]

This show that

\[
p(z) = \int_0^{2\pi} \left( 1 + 2 \sum_{n=1}^{\infty} e^{-int} z^n \right) d\mu(t)
\]

\[
= 1 + 2 \sum_{n=1}^{\infty} \left( \int_0^{2\pi} e^{-int} d\mu(t) \right) z^n
\]

\[
= 1 + \sum_{n=1}^{\infty} p_n z^n
\]

where

\[
p_n = 2 \int_0^{2\pi} e^{-int} d\mu(t).
\]
It follows that
\[ |p_n| = \left| 2 \int_0^{2\pi} e^{-im}d\mu(t) \right| \leq 2 \int_0^{2\pi} d\mu(t) = 2 \]
Furthermore, if \(|p_n| = 2\) then \(t = 0\). Thus we have
\[ p_n = \int_0^{2\pi} \frac{1+z}{1-z}d\mu(t) = \frac{1+z}{1-z} = 1 + \sum_{n=1}^{\infty} 2z^n. \]

**Theorem 1.** A function \(f(z) = \frac{z}{1-z} = z + \sum_{n=2}^{\infty} z^n\) is an extremal function for the class \(K\). A function \(f(z) = \frac{z}{(1-z)^2} = z + \sum_{n=2}^{\infty} n z^n\) is an extremal function for the class \(S^\ast\).

**Proof.** Let \(f(z) \in S^\ast\). Then a function \(p(z)\) given by \(p(z) = \frac{zf'(z)}{f(z)}\) is a Carathéodory function, so that \(p(z) \in P\). Applying Lemma 1, we have that
\[ p(z) = \frac{zf'(z)}{f(z)} = \frac{1+z}{1-z} \]
is the an extremal function for the class \(P\). This gives us that
\[ \frac{f'(z)}{f(z)} = \frac{z}{1-z} = \frac{1}{z} + \frac{2}{1-z} \]
which show that
\[ \log f(z) = \log z - 2 \log(1-z) = \log \frac{z}{(1-z)^2}. \]
Thus we obtain that
\[ f(z) = \frac{z}{(1-z)^2}. \]
Next, we note that \(f \in K\) if and only if \(zf'(z) \in S^\ast\). Thus, we consider
\[ zf'(z) = \frac{z}{(1-z)^2} \]
for an extremal function \(f(z)\) for the class \(K\). It is easy to get
\[ f(z) = \frac{z}{1-z} \]

**Theorem 2.** [3] Let \(f\) be analytic in \(U\), with \(f(0) = 0\) and \(f'(0) = 1\). Then \(f \in C\) if and only if \(zf'(z) \in S^\ast\).

**Corollary 1.** \(k(z)\) is Koebe Function, for which
\[ \frac{zk'(z)}{k(z)} = \frac{1+z}{1-z} \]
clearly offers equality.

**Proof.** The leading example of a function of class \(S\) is the Koebe function indeed;
\[ k(z) = z + \sum_{n=2}^{\infty} m z^n = z + 2z^2 + 3z^3 + 4z^4 + ... \]
\[ k'(z) = 1 + 4z + 9z^2 + 16z^3 + ... \]
\[ zk'(z) = z + 4z^2 + 9z^3 + 16z^4 + ... \]
\[ \frac{z f' (z)}{f(z)} = 1 + 2z + 2z^2 + 2z^3 + \ldots = \frac{1 + z}{1 - z} \]

2 Main theorem

**Theorem 3.** Let \( 0 \leq \alpha \leq \frac{1}{2r + 1} \) and \( z \in U \). Then, an extremal function for \( S^*(\alpha) \) is

\[ f(z) = \frac{z}{(1 - z)^{2(1 - \alpha 2r)}} \]

an extremal function for \( K(\alpha) \) is

\[ f(z) = \frac{1 - (1 - z)\alpha 2r + 1}{\alpha 2r + 1 - 1}, \alpha \neq \frac{1}{2r + 1} \log \left( \frac{1}{1 - z} \right), \alpha = \frac{1}{2r + 1}. \]

**Proof.** Let us consider

\[ F(z) = \frac{zf'(z) - \alpha 2r}{f(z)} \quad f(z) \in S^*(\alpha) \]

Then \( F(z) = 1 + \sum_{1}^{m} b_m e^m \) is analytic in \( U \) and \( ReF(z) > 0, (z \in U) \). Using Lemma 1, if \( F(z) \) is an extremal function for Lemma 1, then

\[ F(z) = \frac{zf'(z) - \alpha 2r}{f(z)} = \frac{1 + z}{1 - z} \]

which is equivalent to

\[ \frac{zf'(z)}{f(z)} - \alpha 2r = (1 - \alpha 2r) \left[ \frac{1 + z}{1 - z} \right] \]

\[ \frac{f'(z)}{f(z)} \frac{\alpha 2r}{z} = \frac{(1 - \alpha 2r)(1 + z)}{z(1 - z)} \]

thus we have

\[ \frac{f'(z)}{f(z)} = \frac{\alpha 2r}{z} + (1 - \alpha 2r) \left[ \frac{1}{z} + \frac{2}{1 - z} \right] \]

integrating both sides, we have that

\[ \int_{0}^{1} \frac{f'(t)}{f(t)} dt = \alpha 2r \int_{0}^{1} \frac{1}{t} dt + (1 - \alpha 2r) \int_{0}^{1} \frac{1}{t} + \frac{2}{1 - t} dt \]

this show that

\[ \log f(t) |_{0}^{1} = \alpha 2r [\log t] |_{0}^{1} + (1 - \alpha 2r) [\log t] |_{0}^{1} - 2(1 - \alpha 2r) [\log (1 - t)] |_{0}^{1} \]

that is, that

\[ \log f(z) = \log \frac{z}{(1 - z)^{2(1 - \alpha 2r)}} \]

\[ f(z) = \frac{z}{(1 - z)^{2(1 - \alpha 2r)}} \]

For \( f(z) \in K(\alpha) \), we use \( z f'(z) \in S^*(\alpha) \). This means that

\[ z f'(z) = \frac{z}{(1 - z)^{2(1 - \alpha 2r)}} \]
since,

\[ f'(z) = \frac{1}{(1-z)^{2(1-\alpha^2)}}. \]

If \( \alpha = \frac{1}{2} \), then

\[ f(z) = \int_0^1 \frac{1}{1-t} dt = -\log(1-t)|_0^1 = \log \frac{1}{1-z} \]

If \( \alpha \neq \frac{1}{2} \), then

\[ f(z) = \int_0^z \frac{1}{(1-t)^{2(1-\alpha^2)}} dt = \int_0^z (1-t)^{2(\alpha^2 r - 1)} dt = \left[ \frac{(1-t)^{2\alpha^2}}{2\alpha^2 r} \right]_0^z = \frac{1 - (1-z)^{\alpha^2 r + 1 - 1}}{\alpha^2 r + 1 - 1}. \]

This completes the proof.

3 Conclusion

In this study we obtained extremal functions for starlike and convex functions according to \( \alpha = \frac{1}{2} \) values changing to between \( 0 \leq \alpha < 1 \) for \( r = 0, 1, 2, \ldots \).
