Abstract: The purpose of this paper is to introduce the concept of $\alpha_{(\gamma,\gamma')}$-open sets in topological spaces and study some of their properties. It also studies the class of $\alpha_{(\gamma,\gamma')}$-generalized closed set in topological spaces and some of their properties.

Keywords: Bioperation, $\alpha$-open set, $\alpha_{(\gamma,\gamma')}$-open set, $\alpha_{(\gamma,\gamma')}$-$\gamma$-closed sets.

1 Introduction

In 1965, Njastad [4] initiated and explored a new class of generalized open sets in a topological space called $\alpha$-open sets. In 1979, S. Kasahara [3] defined the concept of an operation on topological spaces and introduced $\alpha$-closed graphs of an operation. H. Ogata [5] called the operation $\alpha$ as $\gamma$ operation and introduced the notion of $\gamma$-open sets. H. Z. Ibrahim [1] introduced and discussed an operation of a topology $\alpha O(X)$ into the power set $P(X)$ of a space $X$ and also he introduced the concept of $\alpha_{\gamma}$-open sets. In 1992, J. Umehara, H. Maki and T. Noiri [6] defined and discussed the properties of $(\gamma, \gamma')$-open sets. A. B. Khalaf, S. Jafari and H. Z. Ibrahim [2] introduced the notion of $\alpha O(X, \tau)_{(\gamma,\gamma')}$, which is the collection of all $\alpha_{(\gamma,\gamma')}$-open sets in a topological space $(X, \tau)$. In this paper, the author introduce and study the notion of $\alpha O(X, \tau)_{(\gamma,\gamma')}$ which is the collection of all $\alpha_{(\gamma,\gamma')}$-open by using operations $\gamma$ and $\gamma'$ on a topological space $\alpha O(X, \tau)$.

2 Preliminaries

Throughout this paper, $(X, \tau)$ represent nonempty topological space on which no separation axioms are assumed, unless otherwise mentioned. The closure and the interior of a subset $A$ of $X$ are denoted by $Cl(A)$ and $Int(A)$, respectively. A subset $A$ of a topological space $(X, \tau)$ is said to be $\alpha$-open [4] if $A \subseteq Int(Cl(Int(A)))$. The complement of an $\alpha$-open set is said to be $\alpha$-closed. The intersection of all $\alpha$-closed sets containing $A$ is called the $\alpha$-closure of $A$ and is denoted by $\alpha C(A)$. The family of all $\alpha$-open (resp. $\alpha$-closed) sets in a topological space $(X, \tau)$ is denoted by $\alpha O(X, \tau)$ (resp. $\alpha C(X, \tau)$). An operation $\gamma$ [3] on a topology $\tau$ is a mapping from $\tau$ into power set $P(X)$ of $X$ such that $V \subseteq V^\gamma$ for each $V \in \tau$, where $V^\gamma$ denotes the value of $\gamma$ at $V$. An operation $\gamma$: $\alpha O(X, \tau) \rightarrow P(X)$ [1] is a mapping satisfying the condition, $V \subseteq V^\gamma$ for each $V \in \alpha O(X, \tau)$. We call the mapping $\gamma$ an operation on $\alpha O(X, \tau)$. A subset $A$ of $X$ is called an $\alpha_{\gamma}$-open set [1] if for each point $x \in A$, there exists an $\alpha$-open set $U$ of $X$ containing $x$ such that $U^\gamma \subseteq A$. The complement of an $\alpha_{\gamma}$-open set is called $\alpha_{\gamma}$-closed. The set of all $\alpha_{\gamma}$-open sets of $X$ is denote by $\alpha O(X, \tau)_{\gamma}$. The intersection of all $\alpha_{\gamma}$-closed sets containing $A$ is called the $\alpha_{\gamma}$-closure of $A$ and denoted by $\alpha_{\gamma} C(A)$. A point $x \in \alpha Cl_{\gamma}(A)$ if $U^\gamma \cap A \neq \phi$ for each $\alpha$-open set $U$ containing $x$. An operation $\gamma$ on $\alpha O(X, \tau)$ is said to be $\alpha$-regular [1] if for every $\alpha$-open sets $U$ and $V$ containing $x \in X$, there exists an $\alpha$-open set $W$ containing $x$ such that $W^\gamma \subseteq U^\gamma \cap V^\gamma$. A space $X$ is said to be $\alpha_{\gamma}$-regular
3 $\alpha_{(\gamma', \gamma)}$-Open Sets

In this section, we define and discuss the properties of $\alpha_{(\gamma', \gamma)}$-open sets.

**Definition 1.** A subset $A$ of $(X, \tau)$ is said to be $\alpha_{(\gamma', \gamma)}$-open if for each $x \in A$, there exist $\alpha$-open sets $U$ and $V$ of $X$ containing $x$ such that $U \cup V \subseteq A$. The set of all $\alpha_{(\gamma', \gamma)}$-open sets of $(X, \tau)$ is denoted by $\alpha O(X, \tau)_{(\gamma', \gamma)}$.

**Proposition 1.** If $A_i$ is $\alpha_{(\gamma', \gamma)}$-open for every $i \in I$, then $\bigcup \{A_i : i \in I\}$ is $\alpha_{(\gamma', \gamma)}$-open.

**Proof.** Let $x \in \bigcup_{i \in I} A_i$, then $x \in A_i$ for some $i \in I$. Since $A_i$ is an $\alpha_{(\gamma', \gamma)}$-open set, so there exist $\alpha$-open sets $U$ and $V$ of $X$ containing $x$ such that $U \cup V \subseteq A_i \subseteq \bigcup_{i \in I} A_i$. Therefore, $\bigcup_{i \in I} A_i$ is an $\alpha_{(\gamma', \gamma)}$-open set of $(X, \tau)$.

**Remark.** If $A$ and $B$ are two $\alpha_{(\gamma', \gamma)}$-open sets in $(X, \tau)$, then the following example shows that $A \cap B$ need not be $\alpha_{(\gamma', \gamma)}$-open.

**Example 1.** Let $X = \{1, 2, 3\}$ and $\tau = \{\emptyset, X, \{2\}, \{3\}, \{1, 2\}, \{2, 3\}\}$ be a topology on $X$. For each $A \in \alpha O(X, \tau)$, we define two operations $\gamma$ and $\gamma'$, respectively, by

$$A^\gamma = \begin{cases} A \cup \{2\} & \text{if } 3 \in A, \\ A, & \text{if } 3 \notin A, \end{cases}$$

and

$$A'^\gamma = \begin{cases} A, & \text{if } A \neq \{2\}, \\ X, & \text{if } A = \{2\}. \end{cases}$$

Then, it is obvious that the sets $\{1, 2\}$ and $\{2, 3\}$ are $\alpha_{(\gamma', \gamma)}$-open, however their intersection $\{2\}$ is not $\alpha_{(\gamma', \gamma)}$-open.

**Remark.** From the above example, we notice that the family of all $\alpha_{(\gamma', \gamma)}$-open subsets of a space $X$ is a supratopology and need not be a topology in general.

In the following proposition, the intersection of two $\alpha_{(\gamma', \gamma)}$-open sets is also $\alpha_{(\gamma', \gamma)}$-open, under a certain condition.

**Proposition 2.** Let $\gamma$ and $\gamma'$ be $\alpha$-regular operations. If $A$ and $B$ are $\alpha_{(\gamma', \gamma)}$-open, then $A \cap B$ is $\alpha_{(\gamma', \gamma)}$-open.

**Proof.** Let $x \in A \cap B$. Then $x \in A$ and $x \in B$. Since $A$ and $B$ are $\alpha_{(\gamma', \gamma)}$-open sets, there exist $\alpha$-open sets $U$, $V$, $W$ and $S$ containing $x$ such that $U \cup V \subseteq A$ and $W \cup S \subseteq B$. Since $\gamma$ and $\gamma'$ are $\alpha$-regular operations, then there exist $\alpha$-open sets $K$ and $L$ containing $x$ such that $K \cup L \subseteq (U \cap W) \cup (V \cap S) \subseteq (U \cup V) \cap (W \cup S) \subseteq A \cap B$. This implies that $A \cap B$ is an $\alpha_{(\gamma', \gamma)}$-open set.

**Remark.** By the above proposition, if $\gamma$ and $\gamma'$ are $\alpha$-regular operations, then $\alpha O(X, \tau)_{(\gamma', \gamma)}$ forms a topology on $X$.

**Proposition 3.** The set $A$ is $\alpha_{(\gamma', \gamma)}$-open in $X$ if and only if for each $x \in A$, there exists an $\alpha_{(\gamma', \gamma)}$-open set $B$ such that $x \in B \subseteq A$.

**Proof.** Obvious.
Remark. A subset $A$ is an $\alpha_{(id, id')}$-open set of $(X, \tau)$ if and only if $A$ is $\alpha$-open in $(X, \tau)$. The operation $id = id' : \alpha O(X, \tau) \to P(X)$ is defined by $V^{id} = V$ for any set $V \in \alpha O(X, \tau)$. This operation is called the identity operation on $\alpha O(X, \tau)$. Therefore $\alpha O(X, \tau)_{(id, id')} = \alpha O(X, \tau)$.

Remark.[1] A subset $A$ is an $\alpha_{id}$-open set of $(X, \tau)$ if and only if $A$ is $\alpha$-open in $(X, \tau)$. Therefore, we have that $\alpha O(X, \tau)_{id} = \alpha O(X, \tau)$.

Remark. From Remarks 3 and 3, we have $\alpha O(X, \tau)_{(id, id')} = \alpha O(X, \tau)_{id} = \alpha O(X, \tau)_{id'}$.

Remark. The following example shows that the concept of $\alpha_{(\gamma, \gamma')}$-open and open are independent.

Example 2. Let $X = \{1, 2, 3\}$ and $\tau = \{\phi, X, \{1\}\}$ be a topology on $X$. For each $A \in \alpha O(X, \tau)$, we define two operations $\gamma$ and $\gamma'$, respectively, by

$$A^{\gamma} = A^{\gamma'} = \begin{cases} A, & \text{if } A = \{1, 2\}, \\ X, & \text{if } A \neq \{1, 2\}, \\ \phi, & \text{if } A = \phi. \end{cases}$$

Then, $\alpha_{(\gamma, \gamma')}$-open sets are $\phi$, $X$, and $\{1, 2\}$.

Proposition 4. Let $\gamma$ and $\gamma'$ be operations on $\alpha O(X)$. If $A$ is $(\gamma, \gamma')$-open, then $A$ is $\alpha_{(\gamma, \gamma')}$-open.

Proof. Obvious.

The converse of the above proposition need not be true in general as it is shown in the following example.

Example 3. Let $X = \{1, 2, 3\}$ and $\tau = \{\phi, X, \{2\}\}$ be a topology on $X$. For each $A \in \alpha O(X, \tau)$, we define two operations $\gamma$ and $\gamma'$, respectively, by $A^{\gamma} = A^{\gamma'} = A$. Then, $\{1, 2\}$ is $\alpha_{(\gamma, \gamma')}$-open but not $(\gamma, \gamma')$-open.

Proposition 5. If $A$ is $\alpha_{(\gamma, \gamma')}$-open, then $A$ is $\alpha_{(\gamma, \gamma')}$-open.

Proof. Obvious.

The converse of the above proposition need not be true in general as it is shown in the following example.

Example 4. Let $X = \{1, 2, 3\}$ and $\tau = \{\phi, X, \{1\}, \{1, 2\}, \{1, 3\}\}$ be a topology on $X$. For each $A \in \alpha O(X, \tau)$, we define two operations $\gamma$ and $\gamma'$, respectively, by

$$A^{\gamma} = \begin{cases} A \cup \{1\}, & \text{if } 2 \in A, \\ A, & \text{if } 2 \notin A, \end{cases}$$

and

$$A^{\gamma'} = \begin{cases} X, & \text{if } A \neq \{1\}, \\ A, & \text{if } A = \{1\}, \\ \phi, & \text{if } A = \phi. \end{cases}$$

Then, $\{1, 3\}$ is $\alpha_{(\gamma, \gamma')}$-open but not $\alpha_{(\gamma, \gamma')}$-open.

Proposition 6. If $A$ is $\alpha_{(\gamma, \gamma')}$-open, then $A$ is $\alpha_{\gamma'}$-open for any operation $\gamma'$.

Proof. Obvious.

The converse of the above proposition need not be true in general as it is shown in the following example.
Example 5. Let $X = \{1, 2, 3\}$ and $\tau$ be a discrete topology on $X$. For each $A \in \alpha O(X, \tau)$, we define two operations $\gamma$ and $\gamma'$, respectively, by

$$A^\gamma = \begin{cases} A, & \text{if } A = \{3\}, \\
X, & \text{if } A \neq \{3\}, \\
\emptyset, & \text{if } A = \emptyset. \end{cases}$$

and

$$A^{\gamma'} = \begin{cases} X, & \text{if } A \neq \emptyset, \\
\emptyset, & \text{if } A = \emptyset. \end{cases}$$

Then, $\{3\}$ is $\alpha_{\gamma}$-open but not $\alpha_{(\gamma, \gamma')}^\prime$-open.

Remark. $A$ is $\alpha_{\gamma}$-open if and only if $A$ is $\alpha_{(\gamma, \gamma')}$-open.

Remark. [1] Every $\alpha_{\gamma}$-open subset of a space $X$ is $\alpha$-open.

Remark. We have the following implications but none of these implications are reversible.

\[
\begin{array}{ccc}
\alpha_{\gamma}-open & \longrightarrow & \alpha_{(\gamma, \gamma')}-open \\
\downarrow & & \downarrow \\
\alpha-regular & \longrightarrow & \alpha_{(\gamma, \gamma')}-open \\
\downarrow & & \downarrow \\
\alpha_{(\gamma, \gamma')}-open & \longrightarrow & \alpha_{(\gamma, \gamma')}-open
\end{array}
\]

Definition 2. A topological space $(X, \tau)$ is said to be $\alpha_{(\gamma, \gamma')}$-regular if for each point $x$ in $X$ and every $\alpha$-open set $U$ in $X$ containing $x$, there exist $\alpha$-open sets $W$ and $S$ in $X$ containing $x$ such that $W^\gamma \cup S^{\gamma'} \subseteq U$.

Proposition 7. A topological space $(X, \tau)$ with operations $\gamma$ and $\gamma'$ on $\alpha O(X, \tau)$ is $\alpha_{(\gamma, \gamma')}$-regular if and only if $\alpha O(X, \tau) = \alpha_{(\gamma, \gamma')}$.

Proof. Let $(X, \tau)$ be $\alpha_{(\gamma, \gamma')}$-regular and $A \in \alpha O(X, \tau)$. Since $(X, \tau)$ is $\alpha_{(\gamma, \gamma')}$-regular, then for each $x \in A$, there exist $\alpha$-open sets $W$ and $S$ in $X$ containing $x$ such that $W^\gamma \cup S^{\gamma'} \subseteq A$. This implies that $A \in \alpha O(X, \tau)_{(\gamma, \gamma')}$. But we have $\alpha O(X, \tau) \subseteq \alpha O(X, \tau)_{(\gamma, \gamma')}$. Therefore $\alpha O(X, \tau) = \alpha O(X, \tau)_{(\gamma, \gamma')}$. Conversely, let $\alpha O(X, \tau) = \alpha O(X, \tau)_{(\gamma, \gamma')}$, $x \in X$ and $V$ be $\alpha$-open in $X$ containing $x$. Then, by assumption $V$ is $\alpha_{(\gamma, \gamma')}$-open set. This implies that there exist $\alpha$-open sets $W$ and $S$ in $X$ containing $x$ such that $W^\gamma \cup S^{\gamma'} \subseteq V$. Therefore, $(X, \tau)$ is $\alpha_{(\gamma, \gamma')}$-regular.

Remark. If a space $X$ is $\alpha_{(\gamma, \gamma')}$-regular, then $\tau \subseteq \alpha O(X, \tau)_{(\gamma, \gamma')}$.}

Remark. $(X, \tau)$ is $\alpha_{(\gamma, \gamma')}$-regular if and only if it is both $\alpha_{\gamma}$-regular and $\alpha_{\gamma'}$-regular.

Definition 3. A subset $F$ of $(X, \tau)$ is said to be $\alpha_{(\gamma, \gamma')}$-closed if its complement $X \setminus F$ is $\alpha_{(\gamma, \gamma')}$-open. We denote the set of all $\alpha_{(\gamma, \gamma')}$-closed sets of $(X, \tau)$ by $\alpha C(X, \tau)_{(\gamma, \gamma')}$.
Definition 4. Let A be a subset of a topological space \((X, \tau)\). The intersection of all \(\alpha_{(Y',Y)}\)-closed sets containing A is called the \(\alpha_{(Y',Y)}\)-closure of A and denoted by \(\alpha_{(Y',Y)}\)-Cl(A).

Proposition 8. For a point \(x \in X\), \(x \in \alpha_{(Y',Y)}\)-Cl(A) if and only if \(V \cap A \neq \emptyset\) for every \(\alpha_{(Y',Y)}\)-open set V containing x.

Proof. Obvious.

Proposition 9. Let A and B be subsets of \((X, \tau)\). Then the following hold:

1. \(A \subseteq \alpha_{(Y',Y)}\)-Cl(A).
2. If \(A \subseteq B\), then \(\alpha_{(Y',Y)}\)-Cl(A) \(\subseteq\) \(\alpha_{(Y',Y)}\)-Cl(B).
3. \(A \in \alpha_{(X, \tau)}\) if and only if \(\alpha_{(Y',Y)}\)-Cl(A) = A.
4. \(\alpha_{(Y',Y)}\)-Cl(A) \(\subseteq\) \(\alpha_{(Y',Y)}\)-Cl(B).
5. \(\alpha_{(Y',Y)}\)-Cl(A \(\cap\) B) \(\subseteq\) \(\alpha_{(Y',Y)}\)-Cl(A) \(\cap\) \(\alpha_{(Y',Y)}\)-Cl(B).
6. \(\alpha_{(Y',Y)}\)-Cl(A \(\cup\) B) = \(\alpha_{(Y',Y)}\)-Cl(A) \(\cup\) \(\alpha_{(Y',Y)}\)-Cl(B).

Proof. They are obvious.

Remark. From Remark 3 and Definition 3, the following hold for any subset A of X.

1. \(\alpha_{(X, \tau)}\) = \{ F : F is \(\alpha_{(Y',Y)}\)-closed \}.
2. \(\alpha_{(Y,\alpha)}\)-Cl(A) = \(\alpha_{(Y',Y)}\)-Cl(A).

Definition 5. For a subset A of \((X, \tau)\), we define \(\alphaCl_{(Y',Y)}(A)\) as follows: \(\alphaCl_{(Y',Y)}(A)\) = \{ x \in X : (U_{\gamma} \cup W_{\gamma'}) \cap A \neq \emptyset \} holds for every \(\alpha\)-open sets U and W containing x\}.

Proposition 10. For a subset A of \((X, \tau)\), we have

1. \(A \subseteq \alphaCl(A) \subseteq \alphaCl_{(Y',Y)}(A) \subseteq \alpha_{(Y',Y)}\)-Cl(A).
2. \(\alpha_{(Y',Y)}\)-Cl(A) \(\subseteq\) \(\alpha_{(Y',Y)}\)-Cl(A).

Proof. Obvious.

Theorem 1. Let A and B be subsets of a topological space \((X, \tau)\). Then, we have the following properties:

1. \(A \subseteq \alphaCl_{(Y',Y)}(A)\).
2. \(\alphaCl_{(Y',Y)}(\emptyset) = \emptyset\) and \(\alphaCl_{(Y',Y)}(X) = X\).
3. \(A \in \alpha_{(X, \tau)}\) if and only if \(\alphaCl_{(Y',Y)}(A) = A\).
4. If \(A \subseteq B\), then \(\alphaCl_{(Y',Y)}(A) \subseteq \alphaCl_{(Y',Y)}(B)\).
5. \(\alpha\) and \(\gamma\) are \(\alpha\)-regular, then \(\alphaCl_{(Y',Y)}(A \cup B) = \alphaCl_{(Y',Y)}(A) \cup \alphaCl_{(Y',Y)}(B)\).
6. \(\alphaCl_{(Y',Y)}(A \cap B) \subseteq \alphaCl_{(Y',Y)}(A) \cap \alphaCl_{(Y',Y)}(B)\).

Proof. (1), (2) and (4) They are obtained from Definition 5.

3. Suppose A is \(\alpha_{(Y',Y)}\)-closed, so \(X \setminus A\) is \(\alpha_{(Y',Y)}\)-open in \((X, \tau)\). We claim that \(\alphaCl_{(Y',Y)}(A) \subseteq A\). Let \(x \notin A\). There exist \(\alpha\)-open sets U and V of \((X, \tau)\) containing x such that \(U_{\gamma} \cup V_{\gamma'} \subseteq X \setminus A\), that is, \((U_{\gamma} \cup V_{\gamma'}) \cap A = \emptyset\). Hence by Definition 5, we have that \(x \notin \alphaCl_{(Y',Y)}(A)\) and so \(\alphaCl_{(Y',Y)}(A) \subseteq A\). By (1), it is proved that \(\alphaCl_{(Y',Y)}(A) = A\).

Conversely, suppose that \(\alphaCl_{(Y',Y)}(A) = A\). Let \(x \in X \setminus A\). Since \(x \notin \alphaCl_{(Y',Y)}(A)\), there exist \(\alpha\)-open sets U and V containing x such that \((U_{\gamma} \cup V_{\gamma'}) \cap A = \emptyset\), that is, \((U_{\gamma} \cup V_{\gamma'}) \subseteq X \setminus A\). Therefore, A is \(\alpha_{(Y',Y)}\)-closed.

(5) Let \(x \notin \alphaCl_{(Y',Y)}(A) \cup \alphaCl_{(Y',Y)}(B)\). Then, there exist \(\alpha\)-open sets \(U, V, W\) and S of \((X, \tau)\) containing x such that \((U_{\gamma} \cup V_{\gamma'}) \cap S = \emptyset\) and \((W_{\gamma} \cup S_{\gamma'}) \cap B = \emptyset\). Since \(\gamma\) and \(\gamma'\) are \(\alpha\)-regular, by definition of \(\alpha\)-regular, there exist \(\alpha\)-open sets K and L of \((X, \tau)\) containing x such that \(k_{\gamma} \subseteq U_{\gamma} \cap W_{\gamma'}\) and \(L_{\gamma'} \subseteq V_{\gamma'} \cap S_{\gamma}\). Hence, \((k_{\gamma} \cup L_{\gamma'}) \cap (A \cup B) \subseteq ((U_{\gamma} \cap V_{\gamma'}) \cap (A \cup B))\).
Let $A$ be any subset of a topological space $\langle X, \tau \rangle$. Proof. It is clear that every open set in $X$ is $\gamma$-open. Hence, $x \notin Cl\gamma\tau(A \cup B)$. This shows that $\alpha Cl\gamma\tau(A) \cup \alpha Cl\gamma\tau(B) \supseteq \alpha Cl\gamma\tau(A \cup B)$.

(6) This obtained from (4).

**Definition 6.** Let $A$ be a subset of a topological space $\langle X, \tau \rangle$. The union of all $\alpha Cl\gamma\tau$-open sets contained in $A$ is called the $\gamma\tau$-interior of $A$ and is denoted by $\alpha Cl\gamma\tau$-Int$(A)$.

**Proposition 11.** For any subsets $A, B$ of $X$, we have the following:

1. $\alpha Cl\gamma\tau$-Int$(A)$ is an $\alpha Cl\gamma\tau$-open set in $X$.
2. $A$ is $\alpha Cl\gamma\tau$-open if and only if $A = \alpha Cl\gamma\tau$-Int$(A)$.
3. $\alpha Cl\gamma\tau$-Int$(\alpha Cl\gamma\tau$-Int$(A)) = \alpha Cl\gamma\tau$-Int$(A)$.
4. $\alpha Cl\gamma\tau$-Int$(A) \subseteq A$.
5. If $A \subseteq B$, then $\alpha Cl\gamma\tau$-Int$(A) \subseteq \alpha Cl\gamma\tau$-Int$(B)$.
6. $\alpha Cl\gamma\tau$-Int$(A \cup B) \supseteq \alpha Cl\gamma\tau$-Int$(A) \cup \alpha Cl\gamma\tau$-Int$(B)$.
7. $\alpha Cl\gamma\tau$-Int$(A \cap B) \subseteq \alpha Cl\gamma\tau$-Int$(A) \cap \alpha Cl\gamma\tau$-Int$(B)$.

**Proof.** Obvious.

**Proposition 12.** Let $A$ be any subset of a topological space $\langle X, \tau \rangle$. Then, the following statements are true:

1. $X \setminus \alpha Cl\gamma\tau$-Int$(A) = \alpha Cl\gamma\tau$-Cl$(X \setminus A)$.
2. $X \setminus \alpha Cl\gamma\tau$-Cl$(A) = \alpha Cl\gamma\tau$-Int$(X \setminus A)$.
3. $\alpha Cl\gamma\tau$-Int$(A) = X \setminus \alpha Cl\gamma\tau$-Cl$(X \setminus A)$.
4. $\alpha Cl\gamma\tau$-Cl$(A) = X \setminus \alpha Cl\gamma\tau$-Int$(X \setminus A)$.

**Proof.** Obvious.

### 4 $\alpha Cl\gamma\tau$-g-closed sets

In this section, we define and study some properties of $\alpha Cl\gamma\tau$-g-closed sets.

**Definition 7.** A subset $A$ of $\langle X, \tau \rangle$ is said to be an $\alpha Cl\gamma\tau$-g-closed (briefly, $\alpha Cl\gamma\tau$-g-closed) set, if $\alpha Cl\gamma\tau$-Cl$(A) \subseteq U$ whenever $A \subseteq U$ and $U$ is an $\alpha Cl\gamma\tau$-open set in $\langle X, \tau \rangle$.

**Remark.** It is clear that every $\alpha Cl\gamma\tau$-closed set is $\alpha Cl\gamma\tau$-g-closed. But the converse is not true in general as it is shown in the following example.

**Example 6.** Let $X = \{1, 2, 3\}$ and $\tau = \{\emptyset, \{1\}, \{2\}, \{1, 2\}, \{1, 3\}, X\}$. For each $A \in \alpha O(X)$, we define two operations $\gamma$ and $\gamma'$, respectively, by

$$A\gamma = \begin{cases} A, & \text{if } A \in \{\emptyset, \{2\}, \{1, 3\}\}, \\ X, & \text{otherwise.} \end{cases}$$

Now, if we let $A = \{1\}$, since the only $\alpha Cl\gamma\tau$-open supersets of $A$ are $\{1, 3\}$ and $X$, then $A$ is $\alpha Cl\gamma\tau$-g-closed. But, it is easy to see that $A$ is not $\alpha Cl\gamma\tau$-closed.

**Proposition 13.** If $A$ is $\alpha Cl\gamma\tau$-open and $\alpha Cl\gamma\tau$-g-closed, then $A$ is $\alpha Cl\gamma\tau$-closed.

**Proof.** Since $A$ is $\alpha Cl\gamma\tau$-open and $A \subseteq A$, we have $\alpha Cl\gamma\tau$-Cl$(A) \subseteq A$, also $A \subseteq \alpha Cl\gamma\tau$-Cl$(A)$, therefore $\alpha Cl\gamma\tau$-Cl$(A) = A$. That is, $A$ is $\alpha Cl\gamma\tau$-closed.
Proposition 14. The intersection of an $\alpha_{(Y',\tau')}\gamma$-closed set and an $\alpha_{(Y',\tau')}\gamma$-closed set is always $\alpha_{(Y',\tau')}\gamma$-closed.

Proof. Let $A$ be an $\alpha_{(Y',\tau')}\gamma$-closed set and $F$ be an $\alpha_{(Y',\tau')}\gamma$-closed set. Assume that $U$ is an $\alpha_{(Y',\tau')}\gamma$-open set such that $A \cap F \subseteq U$. Set $G = X \setminus F$. Then we have $A \subseteq U \cap G$, since $G$ is $\alpha_{(Y',\tau')}\gamma$-open, then $U \cap G$ is $\alpha_{(Y',\tau')}\gamma$-open and since $A$ is $\alpha_{(Y',\tau')}\gamma$-closed, then $\alpha_{(Y',\tau')}\gamma \text{Cl}(A) \subseteq U \cap G$. Now, $\alpha_{(Y',\tau')}\gamma \text{Cl}(A \cap F) \subseteq \alpha_{(Y',\tau')}\gamma \text{Cl}(A) \cap \alpha_{(Y',\tau')}\gamma \text{Cl}(F) = \alpha_{(Y',\tau')}\gamma \text{Cl}(A) \cap F \subseteq (U \cap G) \cap F = (U \cap F) \cap \phi \subseteq U.$

The intersection of two $\alpha_{(Y',\tau')}\gamma$-closed sets need not be $\alpha_{(Y',\tau')}\gamma$-closed in general. It is shown by the following example.

Example 7. Let $X = \{1, 2, 3\}$ and $\tau$ be a discrete topology on $X$. For each $A \in \alpha O(X)$, we define two operations $\gamma$ and $\gamma'$, respectively, by

$$A^\gamma = A' = \begin{cases} A, & \text{if } A \in \{\phi, \{1\}\}, \\ X, & \text{otherwise.} \end{cases}$$

Set $A = \{1, 2\}$ and $B = \{1, 3\}$. Clearly, $A$ and $B$ are $\alpha_{(Y',\tau')}\gamma$-closed sets, since $X$ is their only $\alpha_{(Y',\tau')}\gamma$-open superset. But, $C = \{1\} = A \cap B$ is not $\alpha_{(Y',\tau')}\gamma$-closed, since $C \subseteq \{1\} \in \alpha O(X, \tau)_{(Y',\tau')}$ and $\alpha_{(Y',\tau')}\gamma \text{Cl}(C) = X \not\subseteq \{1\}.$

Proposition 15. If $\gamma$ and $\gamma'$ are $\alpha$-regular operations on $\alpha O(X, \tau)_{(Y',\tau')}$. Then the finite union of $\alpha_{(Y',\tau')}\gamma$-closed sets is always an $\alpha_{(Y',\tau')}\gamma$-closed set.

Proof. Let $A$ and $B$ be two $\alpha_{(Y',\tau')}\gamma$-closed sets, and $A \cup B \subseteq U$, where $U$ is $\alpha_{(Y',\tau')}\gamma$-open. Since $A$ and $B$ are $\alpha_{(Y',\tau')}\gamma$-closed sets, we have $\alpha_{(Y',\tau')}\gamma \text{Cl}(A) \subseteq U$ and $\alpha_{(Y',\tau')}\gamma \text{Cl}(B) \subseteq U$ and so $\alpha_{(Y',\tau')}\gamma \text{Cl}(A) \cup \alpha_{(Y',\tau')}\gamma \text{Cl}(B) \subseteq U$. But, we have $\alpha_{(Y',\tau')}\gamma \text{Cl}(A) \cup \alpha_{(Y',\tau')}\gamma \text{Cl}(B) = \alpha_{(Y',\tau')}\gamma \text{Cl}(A \cup B)$ by Proposition 9 (6). Therefore, $\alpha_{(Y',\tau')}\gamma \text{Cl}(A \cup B) \subseteq U$ and so $A \cup B$ is an $\alpha_{(Y',\tau')}\gamma$-closed set.

The union of two $\alpha_{(Y',\tau')}\gamma$-closed sets need not be $\alpha_{(Y',\tau')}\gamma$-closed in general. It is shown by the following example.

Example 8. Let $X = \{1, 2, 3\}$ and $\tau$ be a discrete topology on $X$. For each $A \in \alpha O(X)$, we define two operations $\gamma$ and $\gamma'$, respectively, by

$$A^\gamma = A' = \begin{cases} A, & \text{if } A \in \{\phi, \{1, 2\}, \{1, 3\}, \{2, 3\}\}, \\ X, & \text{otherwise,} \end{cases}$$

Let $A = \{1\}$ and $B = \{2\}$. Here $A$ and $B$ are $\alpha_{(Y',\tau')}\gamma$-closed but $A \cup B = \{1, 2\}$ is not $\alpha_{(Y',\tau')}\gamma$-closed, since $\{1, 2\}$ is $\alpha_{(Y',\tau')}\gamma$-open and $\alpha_{(Y',\tau')}\gamma \text{Cl}(\{1, 2\}) = X$.

Proposition 16. If a subset $A$ of $(X, \tau)$ is $\alpha_{(Y',\tau')}\gamma$-closed and $A \subseteq B \subseteq \alpha_{(Y',\tau')}\gamma \text{Cl}(A)$, then $B$ is an $\alpha_{(Y',\tau')}\gamma$-closed set in $(X, \tau)$.

Proof. Let $U$ be an $\alpha_{(Y',\tau')}\gamma$-open set of $(X, \tau)$ such that $B \subseteq U$. Since $A$ is $\alpha_{(Y',\tau')}\gamma$-closed, we have $\alpha_{(Y',\tau')}\gamma \text{Cl}(A) \subseteq U$. Now, by Proposition 9 and assumptions, it is shown that $\alpha_{(Y',\tau')}\gamma \text{Cl}(A) \subseteq \alpha_{(Y',\tau')}\gamma \text{Cl}(B) \subseteq \alpha_{(Y',\tau')}\gamma \text{Cl}(\alpha_{(Y',\tau')}\gamma \text{Cl}(A)) = \alpha_{(Y',\tau')}\gamma \text{Cl}(A) \subseteq U$ and so $\alpha_{(Y',\tau')}\gamma \text{Cl}(B) \subseteq U$. Therefore, $B$ is an $\alpha_{(Y',\tau')}\gamma$-closed set of $(X, \tau)$.

Proposition 17. For each $x \in X$, $\{x\}$ is $\alpha_{(Y',\tau')}\gamma$-closed or $X \setminus \{x\}$ is $\alpha_{(Y',\tau')}\gamma$-closed in $(X, \tau)$.

Proof. Suppose that $\{x\}$ is not $\alpha_{(Y',\tau')}\gamma$-closed. Then, $X \setminus \{x\}$ is not $\alpha_{(Y',\tau')}\gamma$-open. Let $U$ be any $\alpha_{(Y',\tau')}\gamma$-open set such that $X \setminus \{x\} \subseteq U$. Then, this implies $U = X$ and so $\alpha_{(Y',\tau')}\gamma \text{Cl}(X \setminus \{x\}) \subseteq U$. Hence, $X \setminus \{x\}$ is $\alpha_{(Y',\tau')}\gamma$-closed.

Proposition 18. The following statements (1), (2) and (3) are equivalent for a subset $A$ of $(X, \tau)$.

1. $A$ is $\alpha_{(Y',\tau')}\gamma$-closed in $(X, \tau)$.
2. $\alpha_{(Y',\tau')}\gamma \text{Cl}(\{x\}) \cap A \neq \emptyset$ for every $x \in \alpha_{(Y',\tau')}\gamma \text{Cl}(A)$.
3. $\alpha_{(Y',\tau')}\gamma \text{Cl}(A) \setminus A$ does not contain any non-empty $\alpha_{(Y',\tau')}\gamma$-closed set.
Proof. (1) ⇒ (2). Suppose that there exists a point \( x \in \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \) such that \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl} \{ x \} \cap A = \emptyset \). Since \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl} \{ x \} \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{closed} \) by Proposition 9, \( X \setminus \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl} \{ x \} \) is an \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{open} \) set of \( (X, \tau) \). Since \( A \subseteq X \setminus \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl} \{ x \} \) and \( A \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \), this implies \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \subseteq X \setminus \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl} \{ x \} \) and hence \( x \notin \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \). This is a contradiction. Therefore, we conclude that \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl} \{ x \} \cap A = \emptyset \) holds for every \( x \in \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \).

(2) ⇒ (3). Suppose that there exists a non-empty \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{closed} \) set \( F \) such that \( F \subseteq \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \) and so \( A \cap F = \emptyset \). Let \( y \in F \). Then, \( y \in \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \) and \( y \notin \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \). By (2), it is obtained that \( \emptyset = \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl} \{ y \} \cap A \subseteq \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(F) \cap A = F \cap A \) and so \( F \cap A = \emptyset \). This is a contradiction and so (3) is claimed.

(3) ⇒ (1). Let \( A \subseteq U \), where \( U \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{open} \) in \( (X, \tau) \). If \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \) is not contained in \( U \), then \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \cap (X \setminus U) \neq \emptyset \). Now, since \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \cap (X \setminus U) \subseteq \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \) and \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \cap (X \setminus U) \) is a non-empty \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{closed} \) set, we obtain a contradiction and therefore \( A \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \).

Proposition 19. If \( A \) is an \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \) set of a space \( X \), then the following are equivalent:

(1) \( A \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \).

(2) \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \setminus A \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \).

Proof. (1) ⇒ (2). Since \( A \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \), then \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) = A \) holds by Proposition 9 (3) and so \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \setminus A = \emptyset \) and the set \( \emptyset \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \).

(2) ⇒ (1). Since \( A \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \), \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \setminus A \) does not contain any non-empty \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \) subset and so \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \setminus A = \emptyset \). This shows that \( A \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \).

Proposition 20. For a space \((X, \tau)\), the following are equivalent:

(1) Every subset of \( X \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \).

(2) \( \alpha O(X, \tau)_{(\gamma, \gamma')} = \alpha C(X, \tau)_{(\gamma, \gamma')} \).

Proof. (1) ⇒ (2). Let \( U \in \alpha O(X, \tau)_{(\gamma, \gamma')} \). Then, by hypothesis, \( U \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \) which implies that \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(U) \subseteq U \), so, \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(U) = U \). Thus, we have \( U \in \alpha C(X, \tau)_{(\gamma, \gamma')} \); and so \( \alpha O(X, \tau)_{(\gamma, \gamma')} \subseteq \alpha C(X, \tau)_{(\gamma, \gamma')} \).

Conversely, let \( V \in \alpha C(X, \tau)_{(\gamma, \gamma')} \). Then, \( X \setminus V \in \alpha O(X, \tau)_{(\gamma, \gamma')} \). By using the above technique, it is shown that \( V \in \alpha O(X, \tau)_{(\gamma, \gamma')} \) and so \( \alpha C(X, \tau)_{(\gamma, \gamma')} \subseteq \alpha O(X, \tau)_{(\gamma, \gamma')} \). Therefore, we have the proof of (2).

(2) ⇒ (1). If \( A \) is a subset of a space \((X, \tau)\) such that \( A \subseteq U \) where \( U \in \alpha O(X, \tau)_{(\gamma, \gamma')} \), then \( U \in \alpha C(X, \tau)_{(\gamma, \gamma')} \). Therefore \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(A) \subseteq \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Cl}(U) = U \) which shows that \( A \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \).

Definition 8. A subset \( A \) of \( X \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \) if its complement \( X \setminus A \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._closed} \) in \( (X, \tau) \).

It is clear that every \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{open} \) set is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \), but the converse is not true in general as it is shown in the following example.

Example 9. Consider Example 6, if \( A = \{ 2, 3 \} \), then \( A \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \) but not \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{open} \).

Corollary 1. A subset \( A \) of \((X, \tau)\) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \) if and only if \( F \subseteq \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{Int}(A) \) whenever \( F \subseteq A \) and \( F \) is \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{closed} \) in \((X, \tau)\).

Proof. By Definition 8 and Proposition 12, the proof is obtained.

The union of two \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \) sets need not be \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \) in general. It is shown by the following example.

Example 10. Consider Example 7, if \( A = \{ 2 \} \) and \( B = \{ 3 \} \) then \( A \) and \( B \) are \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \) sets in \( X \), but \( A \cup B = \{ 2, 3 \} \) is not an \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \) set in \( X \).

Corollary 2. Let \( \gamma \) and \( \gamma' \) be an \( \alpha \)-regular operations on \( \alpha O(X, \tau) \), and let \( A \) and \( B \) be two \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \) sets in a space \((X, \tau)\). Then \( A \cap B \) is also \( \alpha_{(\gamma, \gamma')}^\gamma \cdot \text{g._open} \).
Proof. By Definition 8 and Proposition 15, it is proved.

Corollary 3. Every singleton point set in a space \((X, \tau)\) is either \(\alpha_{(\gamma, \gamma')}-g\text{-open}\) or \(\alpha_{(\gamma, \gamma')}-g\text{-closed}\).

Proof. By Definition 8 and Proposition 17, it is proved.

Corollary 4. If \(\alpha_{(\gamma, \gamma')}-\text{Int}(A) \subseteq B \subseteq A\) and \(A\) is \(\alpha_{(\gamma, \gamma')}-g\text{-open}\), then \(B\) is \(\alpha_{(\gamma, \gamma')}-g\text{-open}\).

Proof. By Definition 8 and Propositions 12 and 16, the proof is obtained.
