Abstract: This study deals with the singularly perturbed multi-point boundary value problem and an effective numerical method. The method analysis singularly perturbed problem with multi-point boundary value as theoretically and experimentally. It is shown that the presented method has first-order approximation in the discrete maximum norm. The numerical results are presented in table and graphs, and these results come out the validity of the theoretical analysis of our method.

Keywords: Singular perturbation, Finite difference method, Shishkin mesh, Uniformly convergence, Multi-point condition.

1 Introduction

Consider the following second-order linear singularly perturbed multi-point boundary value problem

\[ -\varepsilon u'' + b(x)u(x) = f(x), \quad 0 < x < 1, \]  

(1)

\[ u(0) = 0, \]  

(2)

\[ u(1) = \sum_{i=1}^{m} c_i u(s_i) + d, \]  

(3)

where \( 0 < \varepsilon \ll 1 \) is a small perturbation parameter; \( b, d, m \) and \( c_i \) are given constants, \( 0 < s_i < 1, i = 1, 2, \ldots, m \); and \( b(x) \geq b^2 > 0 \) and \( f(x) \) are assumed to be continuous functions in \([0, 1]\), and moreover

\[ -\infty < \sum_{i=1}^{m} c_i w_0(s_i) < 1, \]

\[ w_0(x) = \frac{1 - e^{-\frac{2b}{\sqrt{\varepsilon}}}}{1 - e^{-\frac{2b}{\sqrt{\varepsilon}}}} e^{\frac{b(x-1)}{\sqrt{\varepsilon}}}. \]

It is a well known fact that differential equations with a small parameter \( \varepsilon \) multiplying the highest-order derivative terms are called singularly perturbed differential equations. Standard numerical methods for solving singularly perturbed problems are fail to give accurate results and unstable due to the perturbation parameter \( \varepsilon \). Therefore, there are some fitted numerical methods to solve equations like these, such finite difference methods, finite element methods etc. So, we prefer to use finite difference method for solving this problem in this paper.

Singular perturbation problems arise in chemical-reactor theory, control theory, oceanography, fluid mechanics, quantum mechanics, hydro mechanical problems, meteorology, electrical networks and other physical models [13,14,17,18,19,20,21,22]. Singularly perturbed differential equations with nonlocal boundary value have been studied by many authors. According to some references, existence and uniqueness of nonlocal problems can be seen in [1,4,22]. A finite difference scheme on an uniform mesh for solving linear (nonlinear) singularly perturbed problem with nonlocal condition have been found in [1,2,3,5,6,7,8,9,10,11,12,15,16].

In the above aforementioned papers, related studies to singularly perturbed problems are related only with the ordinary cases. In addition, available studies for the numerical solution of singularly perturbed problems with multi-point boundary conditions have not widespread yet. It can be seen in [5,10] that various difference schemes exist for multi-point and integral boundary conditions.

In this present paper, we use finite difference method on a Shishkin mesh for the numerical solution of the nonlocal problem (1)-(3). This method is shown uniformly convergent of first-order on Shishkin mesh, in discrete maximum norm. Some properties of the exact solution of the problem described in (1)-(3) is investigated in Section 2. Finite difference schemes on Shishkin mesh for the problem (1)-(3) are constructed in Section 3. The error analysis for the difference scheme is performed in Section 4. Finally, We formulate the iterative algorithm for solving the discrete problem and a numerical example present to find the solution of approximation in Section 5.

Henceforth, $C$, $C_0$ and $C_1$ will mean positive constants independent of $\varepsilon$ and the mesh parameter.

## 2 Some properties of the continuous problem

Here we establish very important asymptotic properties of the exact solution of the problem (1)-(3) that will be used to analyze appropriate finite difference problem.

**Lemma 1.** If $b(x)$ and $f(x)$ be sufficiently smooth on interval $[0, 1]$ and

$$
\sum_{i=1}^{m} c_i w(s_i) < 1,
$$

where $w_0(x) \geq |w(x)|$ is the solution of the following problem

$$
-\varepsilon w'' + b(x) w(x) = 0,
$$

$$
w(0) = 0, w(1) = 1.
$$

Then, the solution of the problem (1)-(3) satisfies the following inequalities:

$$
\|u(x)\|_{C[0,1]} \leq C_0,
$$

where

$$
C_0 = |v(x)| + |\lambda| |w(x)|,
$$

and

$$
|u'(x)| \leq C_1 \left\{ 1 + \frac{1}{\sqrt{\varepsilon}} \left( e^{-\frac{b_0}{\varepsilon}} + e^{-\frac{b(1-x)}{\varepsilon}} \right) \right\}, \quad 0 < x < 1.
$$
Proof. Let us take \( u(1) = \lambda \) and the solution of the problem (1)-(3) as

\[
u(x) = v(x) + \lambda w(x),
\]

where

\[
\lambda = \frac{d + \sum_{i=1}^{m} c_i v(s_i)}{1 - \sum_{i=1}^{m} c_i w(s_i)},
\]

and the function \( v(x) \) is the solution of the following problem

\[-\varepsilon v'' + b(x)v(x) = f(x),
\]

\[v(0) = 0, v(1) = 0.
\]

Now, we use the maximum principle for the evaluation of the functions \( v(x) \) and \( w(x) \), and so we have

\[
|v(x)| \leq |v(0)| + |v(1)| + b^{-2} \|f\|_{C[0,1]} \leq b^{-2} \|f\|_{C[0,1]} \leq C_1,
\]

(7)

and

\[
|w(x)| \leq |w(0)| + |w(1)| \leq 1.
\]

(8)

Finally, from (7) and (8), we obtain

\[
|u(x)| = |v(x)| + |\lambda||w(x)| \leq C_1 + |\lambda| \leq C_0,
\]

which proves (5).

Next, we will examine the inequality (6). Differentiating the Equation (1), we get the relation

\[-\varepsilon u'''(x) + b(x)u'(x) = \Phi(x),
\]

(9)

where

\[
\Phi(x) = f'(x) - b'(x)u(x).
\]

After doing some calculation in the Equation (9), we obtain

\[
|u'(x)| \leq C + \frac{C}{\sqrt{\varepsilon}} \left( e^{-\frac{b}{\sqrt{\varepsilon}}} + e^{-\frac{b(1-x)}{\sqrt{\varepsilon}}} \right) \leq C \left\{ 1 + \frac{1}{\sqrt{\varepsilon}} \left( e^{-\frac{b}{\sqrt{\varepsilon}}} + e^{-\frac{b(1-x)}{\sqrt{\varepsilon}}} \right) \right\},
\]

(see in [8]). Eventually, we have the inequality (6). And so, the proof of Lemma 1 is completed.

3 The Establishment of difference scheme

In here, we discretize the problem (1)-(3) using a finite difference method on a piecewise uniform mesh of Shishkin type. The Shishkin mesh is introduced for this study as follows.
3.1 Shishkin mesh

The approximation to the solution \( u \) of the problem (1)-(3) will be computed on a Shishkin mesh. For a divisible by four positive integer \( N \), we divide the interval \([0, 1]\) into the three subintervals \([0, \sigma]\), \([\sigma, 1 - \sigma]\) and \([1 - \sigma, 1]\). In practice, we usually has \( \sigma \ll 1 \), and so the mesh is fine on the intervals \([0, \sigma]\) and \([1 - \sigma, 1]\) and coarse on the interval \([\sigma, 1 - \sigma]\). Here \( \sigma \) is transition point which is called as following:

\[
\sigma = \min \left\{ \frac{1}{4}, b^{-1} \epsilon \ln N \right\}. \tag{10}
\]

We introduce a set of the mesh points \( \omega_N = \{x_i\}_{i=0}^N \),

\[
\omega_N = \begin{cases} 
  x_i = ih^{(1)}, & \text{for } i = 0, 1, 2, \ldots, \frac{N}{4}; \\
  x_i = \sigma + (i - \frac{N}{4}) h^{(2)}, & \text{for } i = \frac{N}{4} + 1, \ldots, \frac{3N}{4}; \\
  x_i = 1 - \sigma + (i - \frac{3N}{4}) h^{(3)}, & \text{for } i = \frac{3N}{4} + 1, \ldots, N; \\
  h^{(1)} = \frac{4\sigma}{N}, & h^{(2)} = \frac{2(1-2\sigma)}{N}, & h^{(3)} = \frac{4\sigma}{N}. 
\end{cases}
\]

\[
h^{(2)} + \frac{1}{2} (h^{(1)} + h^{(3)}) = \frac{2}{N}, \quad h^{(k)} \leq N^{-1}, \quad k = 1, 3, \quad N^{-1} \leq h^{(2)} \leq 2N^{-1}.
\]

For each \( i \geq 1 \) we set the step-size \( h_i = x_i - x_{i-1}, \ i = 1, 2, \ldots, N \).

3.2 Construction of the difference scheme on Shishkin mesh

We introduce an any non-uniform mesh on the interval \([0, 1]\)

\[
\omega_N = \{0 < x_1 < x_2 < \ldots < x_{N-1} < 1\},
\]

and

\[
\omega_N = \omega_N \cup \{x_0 = 0, x_N = 1\}.
\]

Before describing our numerical method, we introduce some notations for the mesh functions. We define the following finite difference for any mesh function \( g_i = g(x_i) \) given on \( \omega_N \):

\[
g_{k,i} = \frac{g_{i+1} - g_i}{h_i}, \quad g_{k,i} = \frac{g_{i+1} - g_i}{h_{i+1}}, \quad g_{k,j} = \frac{g_{k,i} + g_{k,j}}{2},
\]

\[
g_{k,i} = \frac{g_{i+1} - g_i}{h_i}, \quad g_{k,i+1} = \frac{g_{k,i} - g_{k,i+1}}{h_i}, \quad h_i = \frac{h_{i+1} + h_{i+1}}{2},
\]

\[
\|g\|_\infty \equiv \|g\|_{\infty, \omega_N} := \max_{0 \leq i \leq N} |g_i|.
\]

Now, we construct the difference scheme for the Equation (1). Firstly, we will integrate the Equation (1) over \((x_{i-1}, x_{i+1})\),

\[
\delta_i h_{i}^{-1} \int_{x_{i-1}}^{x_{i+1}} Lu(x) \phi_i(x) dx = \delta_i h_{i}^{-1} \int_{x_{i-1}}^{x_{i+1}} f(x) \phi_i(x) dx, \ i = 1, \ldots, N, \tag{11}
\]
here \( \{ \varphi_i(x) \}_{i=1}^{N-1} \) is the basis functions that \( \{ \varphi_i(x) \}_{i=1}^{N-1} \) has the following form
\[
\varphi_i(x) = \begin{cases} 
\varphi_i^{(1)}(x) = \frac{s_b\gamma(x-x_{i-1})}{s_b\gamma h}, & x_{i-1} < x < x_i, \\
\varphi_i^{(2)}(x) = \frac{s_b\gamma(x-x_{i+1})}{s_b\gamma h}, & x_i < x < x_{i+1}, \\
0, & x \notin (x_{i-1}, x_{i+1}),
\end{cases}
\]

where \( \gamma = \sqrt{\frac{h}{\epsilon}}; \varphi_i^{(1)}(x) \) and \( \varphi_i^{(2)}(x) \), respectively, are the solution of the problems as:
\[
-\epsilon \varphi'' + b_i \varphi = 0, \quad x_{i-1} < x < x_i, \quad \varphi(x_{i-1}) = 0, \quad \varphi(x_i) = 1.
\]
\[
-\epsilon \varphi'' + b_i \varphi = 0, \quad x_i < x < x_{i+1}, \quad \varphi(x_i) = 1, \quad \varphi(x_{i+1}) = 0.
\]

After doing some arrangements in the Equation (11), we have
\[
\delta_i h_i^{-1} \int_{x_{i-1}}^{x_{i+1}} u'(x) \varphi_i'(x) dx + \delta_i b_i h_i^{-1} \int_{x_{i-1}}^{x_{i+1}} u(x) \varphi_i(x) dx = f_i + R_i, \quad i = 1, \ldots, N - 1,
\]
where
\[
R_i = \delta_i h_i^{-1} \int_{x_{i-1}}^{x_{i+1}} [b(x_i) - b(x)] u(x) \varphi_i(x) dx + \delta_i h_i^{-1} \int_{x_{i-1}}^{x_{i+1}} [f(x) - f(x_i)] \varphi_i(x) dx,
\]
and
\[
\delta_i = \left( h_i^{-1} \int_{x_{i-1}}^{x_{i+1}} \varphi_i(x) dx \right)^{-1}.
\]

Using the interpolating quadrature rules (2.1) and (2.2) from [4] with weight functions \( \varphi_i(x) \) on subintervals \((x_{i-1}, x_{i+1})\) from (12), we obtain the following precise relation:
\[
l u_i := -\epsilon \theta_i u_{i-1} + b_i u_i = f_i + R_i, \quad i = 1, \ldots, N,
\]

where
\[
\theta_i = \frac{b_i h_i^2}{4 \epsilon \gamma h^2 \left( \frac{2 h_i^2}{\gamma} \right)}.
\]

If we neglect \( R_i \) in the Equation (14), we can suggest the following difference scheme for the problem (1)-(3):
\[
l y_i := -\epsilon \theta_i y_{i-1} + b_i y_i = f_i, \quad i = 1, \ldots, N,
\]
\[
y_0 = 0,
\]
\[
y_N = \sum_{i=1}^{m} c_i y_i(x_{N_i}) + d,
\]

where \( x_{N_i} \) is the mesh point nearest to \( s_i \), and \( \theta_i \) is given by (15).
4 Uniform error estimates

In this part, we will investigate the convergence of the method for the problem (1) and (3). We will give the error function

\[ z_i = y_i - u_i, \quad i = 0, 1, ..., N, \]

where \( z_i \) is the solution of the discrete problem

\[ -\varepsilon \theta_i \bar{z}_{\bar{x}, i} + b_i z_i = R_i, \quad i = 1, ..., N, \]

\[ z_0 = 0, \]

\[ z_N = \sum_{i=1}^{m} c_i z_N, \quad (21) \]

where \( R_i \) and \( \theta_i \) are defined by (13) and (15), respectively.

**Lemma 2.** Let \( z_i \) be the solution (19)-(21) and

\[ \sum_{i=1}^{m} c_i z_2(s_i) \neq 1. \]

Then the estimate

\[ \|z\|_{\infty, \theta_N} \leq C \|R\|_{\infty, \theta_N}, \]

holds.

**Proof.** Let \( z(x) = z_1(x) + \lambda z_2(x) \) be the solution of the discrete problem (19)-(21), where \( z_1(x) \) and \( z_2(x) \) are the solution of the following problems, respectively:

\[ -\varepsilon \theta_i \bar{z}_{\bar{x}, i} + b_i z_i = R_i, \quad i = 1, ..., N, \]

\[ z_1(0) = 0, \quad z_1(1) = 0, \]

and

\[ -\varepsilon \theta_i \bar{z}_{\bar{x}, i} + b_i z_i = 0, \quad i = 1, ..., N, \]

\[ z_2(0) = 0, \quad z_2(1) = 1, \]

where

\[ \lambda = \frac{d + \sum_{i=1}^{m} c_i z_1(s_i)}{1 - \sum_{i=1}^{m} c_i z_2(s_i)}, \]

\[ 1 - \sum_{i=1}^{m} c_i z_2(s_i) \neq 0. \]

According to the maximum principle for \( z_1(x) \) and \( z_1(x) \), we have the following evaluations:

\[ |z_1(x)| \leq |z_1(0)| + |z_1(1)| + \hat{b}^{-2} \|R\|_{\infty, \theta_N} \leq C \|R\|_{\infty, \theta_N}, \]

and

\[ |z_2(x)| \leq |z_2(0)| + |z_2(1)| \leq 1. \]
Next, we have from (23) and (24)
\[ |z_i(x)| \leq |z_1(x)| + |\lambda_i| |z_2(x)| \leq b^{-2} \|R\|_{\infty, \partial\Omega} + |\lambda| \leq C \|R\|_{\infty, \partial\Omega}, \]
which proves Lemma 2.

**Lemma 3.** Under the assumptions of section 1 and Lemma 2 the solution of the problem (1)-(3) satisfies the following estimates for the remainder term \(R_i\):
\[ \|R\|_{\infty, \partial\Omega} \leq CN^{-1} \ln N. \tag{25} \]

**Proof.** The reminder term \(R_i\) can be rewritten with (2) and using mean value theorem as
\[ |R_i| \leq \delta h_i^{-1} \int_{x_{i-1}}^{x_{i+1}} Ch_i C_0 \phi_i(x) dx + \delta h_i^{-1} \int_{x_{i-1}}^{x_{i+1}} Ch_i \phi_i(x) dx \leq C h_i. \]
Now, we will evaluate \(R_i\) for the intervals \([0, \sigma]\), \([\sigma, 1 - \sigma]\) and \([1 - \sigma, 1]\), respectively.
In the first case, for \(\frac{1}{4} > b^{-1} \varepsilon \ln n = \sigma\) and the interval \([0, \sigma]\):
\[ |R_i| \leq C h^{(1)} = \frac{4C \sigma}{N} \leq \frac{4b^{-1} \varepsilon \ln N}{N} \leq CN^{-1} \ln N, \quad i = 1, \ldots, \frac{N}{4} - 1. \]
In the second case, for \(\frac{1}{4} > b^{-1} \varepsilon \ln n = \sigma\) and the interval \([\sigma, 1 - \sigma]\):
\[ |R_i| \leq C h^{(2)} = \frac{2C (1 - 2 \sigma)}{N} = \frac{2C (1 - 2b^{-1} \varepsilon \ln N)}{N} \leq CN^{-1} \ln N, \quad i = \frac{N}{4} + 1, \ldots, \frac{3N}{4} - 1. \]
In the third case, for \(\frac{1}{4} > b^{-1} \varepsilon \ln n = \sigma\) and the interval \([1 - \sigma, 1]\):
\[ |R_i| \leq C h^{(3)} = \frac{4C \sigma}{N} \leq \frac{4b^{-1} \varepsilon \ln N}{N} \leq CN^{-1} \ln N, \quad i = \frac{3N}{4} + 1, \ldots, N. \]
and then, we evaluate \(R_i\) for \(i = \frac{N}{4}\) and \(i = \frac{3N}{4}\), respectively:
\[ |R_{\frac{N}{4}}| \leq Ch = C h^{(1)} = C 4 \sigma N^{-1} \leq 4CN^{-1} b^{-1} \varepsilon \ln N \leq CN^{-1} \ln N, \]
and
\[ |R_{\frac{3N}{4}}| \leq Ch = C h^{(2)} = 2C (1 - 2b^{-1} \varepsilon \ln N) N^{-1} \leq CN^{-1} \ln N. \]
According to all these situations, we have
\[ |R_i| \leq C h_i \leq CN^{-1} \ln N. \]
This completes the proof of Lemma 3.

We can state the convergence result of this study the following Theorem 4.

**Theorem 1.** Let \(u(x)\) be the solution of the problem (1)-(3) and \(y_i\) be the solution of the difference scheme (16)-(18). Then, the following uniform error estimate satisfies
\[ \|y - u\|_{\infty, \partial\Omega} \leq CN^{-1} \ln N. \]
5 Algorithm and numerical results

Here an effective algorithm has been given for the solution of the difference scheme (16)-(18) and numerical results have also been displayed in table and graphs.

(a) We give the algorithm for the solution of the difference scheme (16)-(18):

\[
\left( \frac{\varepsilon \theta_i}{h_i h_j} \right) y_{i-1} - \left( \frac{2 \varepsilon \theta_i}{h_i h_{i+1}} + h_i \right) y_i + \left( \frac{\varepsilon \theta_i}{h_i h_{i+1}} \right) y_{i+1} = -f_i, \quad i = 1, \ldots, N - 1,
\]

\[ A_i = \frac{\varepsilon \theta_i}{h_i h_i}, \quad B_i = \frac{\varepsilon \theta_i}{h_i h_{i+1}}, \quad C_i = \frac{\varepsilon \theta_i}{h_i h_{i+1}} + h_i, \]

\[ \alpha_1 = 0, \quad \beta_1 = 0, \quad \alpha_{i+1} = 0, \quad \beta_{i+1} = \mu_1, \]

\[ \alpha_{2N+1} = 0, \quad \beta_{2N+1} = \mu_2, \quad \alpha_{2N+1} = 0, \quad \beta_{2N+1} = \mu_3, \]

\[ \frac{\alpha_i}{\beta_i} + \frac{\alpha_{i+1}}{\beta_{i+1}} = 0, \quad i = 1, \ldots, N - 1, \]

\[ y_i^{(n)} = \alpha_{i+1} y_{i+1}^{(n)} + \beta_{i+1}, \quad i = N - 1, \ldots, 2, 1. \]

(b) We examine the following problem to see how the method works:

\[ -\varepsilon u''(x) + u(x) = -\cos^2(\pi x) - 2\varepsilon \pi^2 \cos(2\pi x), \quad 0 < x < 1, \]

\[ u(0) = 0, \quad u(1) = 0.03u(0.9) + 0.2u(0.1) + 0.5u(0.2) + 0.09u(0.5) + d, \]

where

\[ d = 0.192 + \frac{0.4415 e^{\frac{1}{\sqrt{\varepsilon}}}}{1 + e^{-\frac{1}{\sqrt{\varepsilon}}}}. \]

We have the exact solution of this problem as

\[ u(x) = \frac{\exp \left( -\frac{x}{\sqrt{\varepsilon}} \right) + \exp \left( \frac{x}{\sqrt{\varepsilon}} \right)}{1 + \exp \left( -\frac{1}{\sqrt{\varepsilon}} \right)} - \cos^2(\pi x). \]

The corresponding \( \varepsilon \)– uniform convergence rates are computed using the formula

\[ p^N = \ln \left( \frac{e^N}{e^{2N}} \right) / \ln 2. \]

The error estimates are denoted by

\[ e^N = \max_{x \in [0,1]} e^N_x, \quad e^N_x = \|y - u\|_{\infty, \theta_N}, \]

6 Conclusion

In this study, we have offered an effective finite difference method for solving second-order linear singularly perturbed multi-point boundary value problem. The method has display uniform convergence with respect to the perturbation.

Fig. 1: Comparison of approximate solution and exact solution for $N = 80$, $\varepsilon = 2^{-4}$.

Fig. 2: Exact solution distribution for $N = 40$, $\varepsilon = 2^{-4}, \ldots, 2^{-8}$.
parameter $\varepsilon$. Also, the method is first order convergent in the discrete maximum norm. Numerical example shows that recommended method has a good approximation characteristic as: in table and graphics, when $N$ takes increasing values, it is seen that the convergence rate of the smooth convergence speed $p_N$ is first order. The exact solution and approximate solution curves are almost identical as shown in Figure 1. In Figure 2, as $\varepsilon$ values decrease, the graph approaches more towards the coordinate axes in the boundary layer region around $x = 0$ and $x = 1$. In Figure 3, the errors in these regions are maximum because of the irregularity caused by the sudden and rapid change of solution in the boundary layer region around $x = 0$ and $x = 1$ for different values $\varepsilon$. Thus, numerical results prove that the proposed scheme is working very well.
